

Reflection Paper:

After reading different articles about security awareness training, I realized how big a role ordinary people play in keeping systems safe. The University of Chicago (2025) explained that many companies still rely on boring annual lessons that don't really teach employees how to react to real attacks. That made me think about how I usually ignore those cyber safety reminders online and how risky that habit actually is. I also learned from BR SiDE Academy (2025) that good training should be interactive and realistic, not just slides full of text. When people see real examples of scams or phishing, they remember better and act smarter. ISACA (2025) mentioned that a strong security culture starts when everyone feels responsible for protecting data, not only the IT staff. That inspired me to be more careful with my passwords and links I click on. I now understand that human mistakes are the biggest reason why hackers succeed, but they can be avoided with the right mindset. Security awareness training helps turn users from weak spots into defenders. I learned that being aware and informed isn't just for work it's part of being a responsible internet user every day.
